

WebMind

MVP Product Requirements Document (PRD)

Version: 1.0 **Date:** September 2, 2026

1. Product Overview

WebMind is a browser extension that adds a persistent AI workspace to the web. It lets users ask questions about the current webpage, keep notes and highlights, and automatically reconnect that activity to the page when they return later.

The MVP is intentionally focused: the product should prove that page-aware AI plus persistent page-specific knowledge is more useful than a generic AI sidebar.

2. Problem Statement

Users frequently research, study, shop, read documentation, and browse articles across many pages. Existing AI sidebars can answer questions about a page, but the user's context often disappears into a general chat history. Notes are also usually separate from the page where they were created.

WebMind solves this by creating a persistent relationship between the user, the webpage, their AI conversations, notes, and highlights.

3. Product Vision

Become a personal knowledge layer for the web: whenever a user returns to a page, WebMind remembers what they asked, saved, highlighted, and noted there.

4. Target Users

- Students researching academic or educational content.
- Developers reading documentation, GitHub pages, tutorials, and technical articles.
- Researchers collecting information across many websites.
- Professionals comparing products, companies, regulations, or industry information.
- General users who want persistent AI assistance while browsing.

5. MVP Goals

- Provide reliable AI Q&A grounded in the current webpage.
- Persist conversations against a specific page.
- Allow users to create and manage page-specific notes.
- Allow users to save selected text as highlights.
- Restore relevant history, notes, and highlights when the same page is revisited.
- Provide a simple global history/search view for the user's saved web knowledge.

6. Non-Goals for MVP

- Full autonomous browsing or multi-agent web automation.
- Perfect support for every dynamic or authenticated website.
- A full standalone note-taking application.
- Complex team collaboration or shared workspaces.
- Automatic knowledge-graph generation.
- Mobile browser support.
- Advanced AI personalization beyond page/user history.

7. Core User Experience

The extension appears as a browser sidebar. The sidebar detects the current page and provides three primary areas: Ask, Notes, and History.

Area	MVP behavior
Ask	User asks a question; AI answers using the current page context and conversation context.
Notes	User creates, edits, deletes, and views notes associated with the current page.
Highlights	User selects text and saves it as a highlight associated with the current page.
History	User sees previous conversations/activity for the current page and can search saved activity globally.
Page context	Extension identifies the current page using URL/domain/title and a normalized page identity.

8. Key User Stories

- As a user, I want to open WebMind on a webpage and ask questions about what I am reading.
- As a user, I want my questions and AI answers to remain attached to that page.
- As a user, I want to select text and save it as a highlight.
- As a user, I want to write a note while reading without leaving the webpage.
- As a user, I want to return later and see my previous questions, notes, and highlights for that page.
- As a user, I want to search my saved notes and conversations across pages.

9. MVP Feature Requirements

9.1 Authentication & Account

- User can create/sign into an account.
- Authenticated data is isolated per user.
- Extension maintains a secure session/token.

9.2 Page Detection & Context

- Detect active tab URL, title, and domain.
- Normalize URL to reduce duplicate records caused by common tracking parameters.
- Extract readable page text where technically possible.
- Send relevant page content/context to the backend AI pipeline.
- Store a page record so activity can be associated with it.

9.3 AI Q&A

- User enters a natural-language question.
- AI receives page context plus relevant conversation context.
- Answer is displayed in the sidebar.
- Conversation is saved automatically.
- User can start a new conversation for the same page.

9.4 Notes

- Create a note from the current page.
- Edit and delete notes.
- Notes contain text, page association, timestamps, and optional source/selection metadata.
- Show notes when revisiting the page.

9.5 Highlights

- User selects text on the page.
- Extension offers Save Highlight / Ask AI / Add Note actions.
- Saved highlight stores selected text and page association.
- Show saved highlights in the page workspace.

9.6 Page History

- Show previous questions and answers for the current page.
- Show note and highlight counts.
- Show last activity time.
- Allow reopening an old conversation.

9.7 Global Search

- Search saved notes and conversation content.
- Results identify the source page.
- Open the relevant page/workspace from a result.

10. Success Metrics

Metric	MVP target / signal
Activation	User completes first page question or saves first note/highlight.
Return usage	Users revisit WebMind on previously visited pages.
Persistence value	Users reopen previous page conversations/notes.
Engagement	Questions, notes, highlights, and returning sessions per active user.
AI usefulness	User feedback/rating on answers grounded in page content.

11. MVP Technical Direction

- Browser: Chrome/Chromium extension using Manifest V3, with a sidebar/side-panel experience.

- Frontend: React or another lightweight web UI framework.
- Backend: REST API or equivalent service for authentication, pages, conversations, notes, highlights, and AI requests.
- Database: PostgreSQL for users, pages, conversations, messages, notes, and highlights.
- AI: LLM API with prompt/context assembly on the backend.
- Optional vector search: PostgreSQL with pgvector for semantic search across saved notes/conversations and later cross-page knowledge features.

12. High-Level Data Model

Entity	Purpose
users	Account and identity.
pages	Canonical/normalized representation of visited webpages.
conversations	A user's AI session associated with a page.
messages	User questions and AI answers.
notes	User-authored information associated with a page.
highlights	Selected webpage text saved by the user.
activity/history	Optional event layer for visits, saves, and other interactions.

13. MVP Release Criteria

- Extension can be installed and authenticated.
- Opening the extension on a supported webpage identifies the page.
- AI can answer questions using the current page content.
- Conversation persists after closing/reopening the browser.
- Notes and highlights persist and are associated with the correct page.
- Returning to a page restores its workspace.
- Global saved-content search works.
- Basic security, rate limiting, error handling, and privacy controls are implemented.

14. Future Roadmap

- Cross-page AI comparison and synthesis.
- Semantic search over the user's complete web knowledge.
- Automatic linking of related pages and notes.
- Personal knowledge graph.
- AI-generated research summaries and collections.
- Tags, folders, projects, and workspaces.
- Export to Markdown/PDF/Notion-style destinations.
- Smarter page identity for dynamic websites.
